Meeting notes

Meeting of the Swedish Library Technology Provider Network 2024-04-16

Date: 2024-04-16

Location: The National Library of Sweden and online (Zoom)

Participants:

Axiell: Magdalena Olofsson, Emma Tennevall

EBSCO: Mats Påhlsson, Richard Burkitt

Ex Libris: Dana Moshkovits, Ronald van Dieen

imCode: Hillar Loor, Tomas Holasek

Index data: Charlotte Whitt

Innovative Interfaces: James Baker Kreablo: Anna Bauer, Andreas Jonsson

Systematic: Jesper Hansen, Helena Nordqvist

The National Library of Sweden: Andreas Mace, Johan Ahrén, Katja Naischtein,

Oskar Laurin

Appendix: PDF-version of PowerPoint presentation held at the meeting

§ 1. Introductions

Andreas welcomed everyone to this first meeting of the Swedish Library Technology Provider Network. NLS has seen the need for more structured discussions with all technology providers active in Sweden for some time and are glad that it's finally happening.

Everyone introduced themselves.

§ 2. Form and structure of the network

These meetings will be held once or maybe twice a year and it will be predominately online.

The network will be loosely structured with no formal statutes. Openness is important and we will publish the meeting notes on our website - https://metadatabyran.kb.se

Max two participants per vendor. New vendors are welcome if they have Swedish customers that are part of the Swedish national library infrastructure and Libris.

§ 3. Linked data from Libris to local library systems (ILS/LSP)

The National Library of Sweden wants to inform and receive feedback on upcoming work with providing data delivery ("exports") of linked data from Libris to local library systems (ILS/LSP predominantly, but possible also Discovery etc.).

Andreas talked about linked data and how the development has progressed in Libris. NLS aims to leave MARC behind completely and eventually transition fully to linked data. The ambition is to restrict the requirement to convert data back and forth from MARC to linked data. We need to provide ways for libraries to access the data and to have ways to fetch and store the data.

NLS also wants to sync holdings and item data back to Libris. The main goal for this is to remove the double work required. One shouldn't have to do the same thing both in Libris and in the local system.

NLS is implementing a new LSP, FOLIO and VuFind, with go live planned for 2025. The work being done with integration Libris and local ILS/LSP through linked data is a part of this implementation, but the ambition is that it will be a generic solution that works with other systems and not limited to NLS choices. Libris will continue to serve as the union catalogue for all public libraries in Sweden, and is the point where metadata is created.

Timeline: NLS will start work on providing linked data from Libris this spring, tests and evaluation during the summer, leading up to active development work fall 2024.

The technology providers asked questions regarding the existing solutions for cataloging in Libris and exports to local ILS/LSP, as well as the relationship between Libris and Library of Congress in regards to BIBFRAME and the flavor/extension used in Libris.

§ 4. Things to explore & discuss

NLS wants to build something that works for all systems in use in Sweden, which can manage linked data. We are however early with this development work in an international context, there are no standards implemented yet. There are more questions than answers at this point and NLS wants input and opinions from the technology providers.

- Several questions/topics were discussed in more detail:
- What protocols/mechanisms will be provided?
- Form/shape of the data
- What feeds will be supported from Libris?
- How much will Libris provide (in terms of packaging data) vs. what is the responsibility of the local system to fetch and store data?
- Define local metadata needs? Operational metadata, caching data etc.

• How do we sync holding/item data back to Libris?

The participants were interested and there were several questions asked during these topics. One of the things discussed was if KBV (the vocabulary used in Libris, mostly based on BIBFRAME with some deviations) will be mapped to BIBFRAME when exporting data, where the answer is that this is an outstanding question what format/serialization will be available. But it is doable already today, and not a difficult question technically but rather a usage and requirement issue.

Another aspect that was raised during the discussion is that it is important to consider how the data will be displayed and used in front end and discovery solutions. Andreas replied that the first step is to get the data into the back-end systems. The next step is to present it effectively in the front-end.

The relationship between holdings and items, and where this data is used (Libris or locally in ILS/LSP) was another topic discussed. This question is also related to how this data can be synced back to Libris, and the responsibility between the involved systems. NLS described that work will happen around the holdings model (including items) in Libris, which may lead to changes. Such changes could potentially also affect those who still use MARC21.

Everyone was interested in continuing to participate and explore this. NLS will stay in touch with the whole group and keep everyone updated. Questions or input can be sent to andreas.mace@kb.se.

Meeting notes: Johan Ahrén, Andreas Mace

Swedish Library Technology Provider Network

Meeting 2024-04-16

Agenda

- Introductions
- Form and structure of the network
- Future meetings structure and frequency
- Main topic: data delivery ("exports") of linked data from Libris to local library systems (ILS/LSP)
- Other topics/questions

Form and structure of the network

- NLS organizes the network and its meetings
- Max two participants per vendor
- Focus on ILS/LSP providers and Swedish national library infrastructure, esp. Libris
- Loosely structured, no formal statures
- Openess important, including publicly published meeting notes
- New vendors welcome if they meet the criteria
- Thoughts?

Future meetings structure & frequency

- How often do we want to meet? In what way? (On premise, online, hybrid)
- NLS suggestion is to meet at least once a year, but possibly two times (one spring, one fall) if there
 are current topics to discuss

Linked data from Libris to local library systems (ILS/LSP)

Exports from Libris today

- The current solution is based on MARC21
- Three main ways of exporting data:
 - MARC export API
 - Batch exports (nightly)
 - OAI-PMH

Moving from MARC21 to linked data

Linked data: work

What we want to do

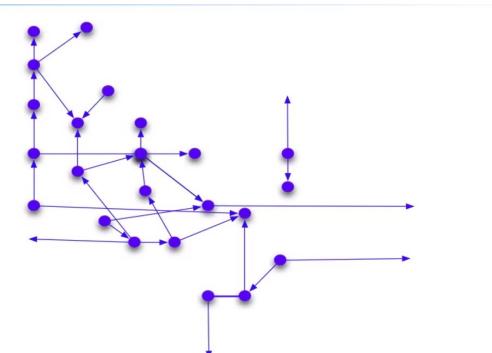

- Support delivery of data ("exports") of linked data from Libris
- Explore solutions for receiving, storing and using the data locally
 - NLS will use FOLIO LSP, other options (systems) for testing is of interest
- Sync holdings/item data back to Libris

Our goals

- Utilize promise of linked data and move away from MARC
- Bring Libris and local ILS/LSP:s closer
- Remove obstacles and unnecessary double work in libraries

Where we are today

- Planning workshops, detailing what needs to be done, by whom and when
- Will start work this spring, leading up to active development work fall 2024
- Short timeframe first a workable implementation and then iterate

Timeline

Preparation & planning Spring 2024 Exploration, tests & evaluation Summer 2024

Development Fall 2024

Things to explore & discuss

What protocols/mechanisms will be provided?

Form/shape of the data

What "feeds" will be supported from Libris?

- How much will Libris provide (in terms of packaging data) vs. what is the responsibility of the local system to fetch and store data?
- Define local metadata needs? Operational metadata, caching data etc.

How do we sync holding/item data back to Libris?

We want input, ideas, opinions from you!

Protocols/mechanisms

- Don't want to build custom solutions if it can be avoided
- What's happening internationally? BIG (BIBFRAME Interoperability Group) etc.
- Standards should be based on RDF
- Possible protocols:
 - Resource sync
 - Activity streams
 - Others?

Form/shape of the data

- BIBFRAME? KBV? Other forms or metadata formats?
- What serializations should we provide? JSON-LD, Turtle, others?

What "feeds" will be supported?

- Today we provide three sets/collections: auth, bib and holdings
- What types of data do we want to "listen to" in the future?

How much will Libris provide vs. what is the responsibility of the local system?

- What is the responsibility of the ILS/LSP in regards to fetching and storing data?
- Packaging of data from Libris vs. follow the links (i.e. actual use of linked data)?

Local metadata needs

- Define what metadata is needed locally as operational metadata
- Caching data locally for other needs/functions (searching, rapports, statistics etc.)

How do we sync holding/item data back to Libris?

- NLS will explore holdings and items in Libris
- Model holdings and define important properties in Libris
- What mechanisms can be used to sync data back to Libris?

More things to explore & discuss

- We want input, ideas, opinions from you!
- What is in the pipeline for you?
- What would be the dream solution for you?
